

Environmental Innovation in the Service of Society

Ent is a multidisciplinary group of professionals working towards a more equitable and environmentally conscious society.

We develop and implement innovative ideas to work towards a more sustainable society putting these ideas into practice and effectively communicating the obtained results.

This is primarily achieved in two ways: assessment and consultancy on environmental innovation (through Ent environment and management) and applied research on environmental issues (through Fundació Ent).

Our Customers

We provide services for a diverse range of clients including local, regional and national public authorities; academic institutions; and an array of private sector organizations.

Ent and Fundació Ent

C/Sant Joan, 39, first floor
Vilanova i la Geltrú

Ecological economics and environmental taxation

The disregard of our economic system to the environmental issues is a major cause of many adverse ecological impacts. We apply our economic analysis to different areas (water, energy, waste, territory, biodiversity among others) and enable the implementation of environmental economic policy instruments within these fields.

Waste management

Waste generation has become a significant global problem. We aim to develop new ideas to address the root of this problem, focussing on waste prevention and improving the results of separate collection.

We communicate

- The results of our research and projects have been published in peer reviewed technical and scientific journals (both national and international), books, reports and web pages, reaching a wide and diverse audience.
- We have successfully organised and facilitated international conferences, symposiums and workshops.
- We coordinate a series of publications on environmental innovation.
- Since 2006 we coordinate and govern the technical secretariat of the international Journal *Ecología Política*.

Energy management

Energy is the basis of our society. Current energy models produce significant social and environmental impacts. We work to achieve new energy models based on intelligent use of energy and on renewable energy sources.

Environment and society

From political ecology to environmental justice, we promote projects in different fields such as food, fishing, or environmental indicators, finding solutions that simultaneously lead to a positive outcome for environmental concerns and to fairer economic system and social policies.
